CUSTOMER CHURN DASHBOARD

Why did 56.7% of customers leave, and who is next?

A Power BI dashboard on who leaves, what it costs, and which active customers to contact first.

A subscription business lost 250K of 441K customers, about 135M in revenue

441K

customers in the data

250K

customers churned (56.7%)

135M

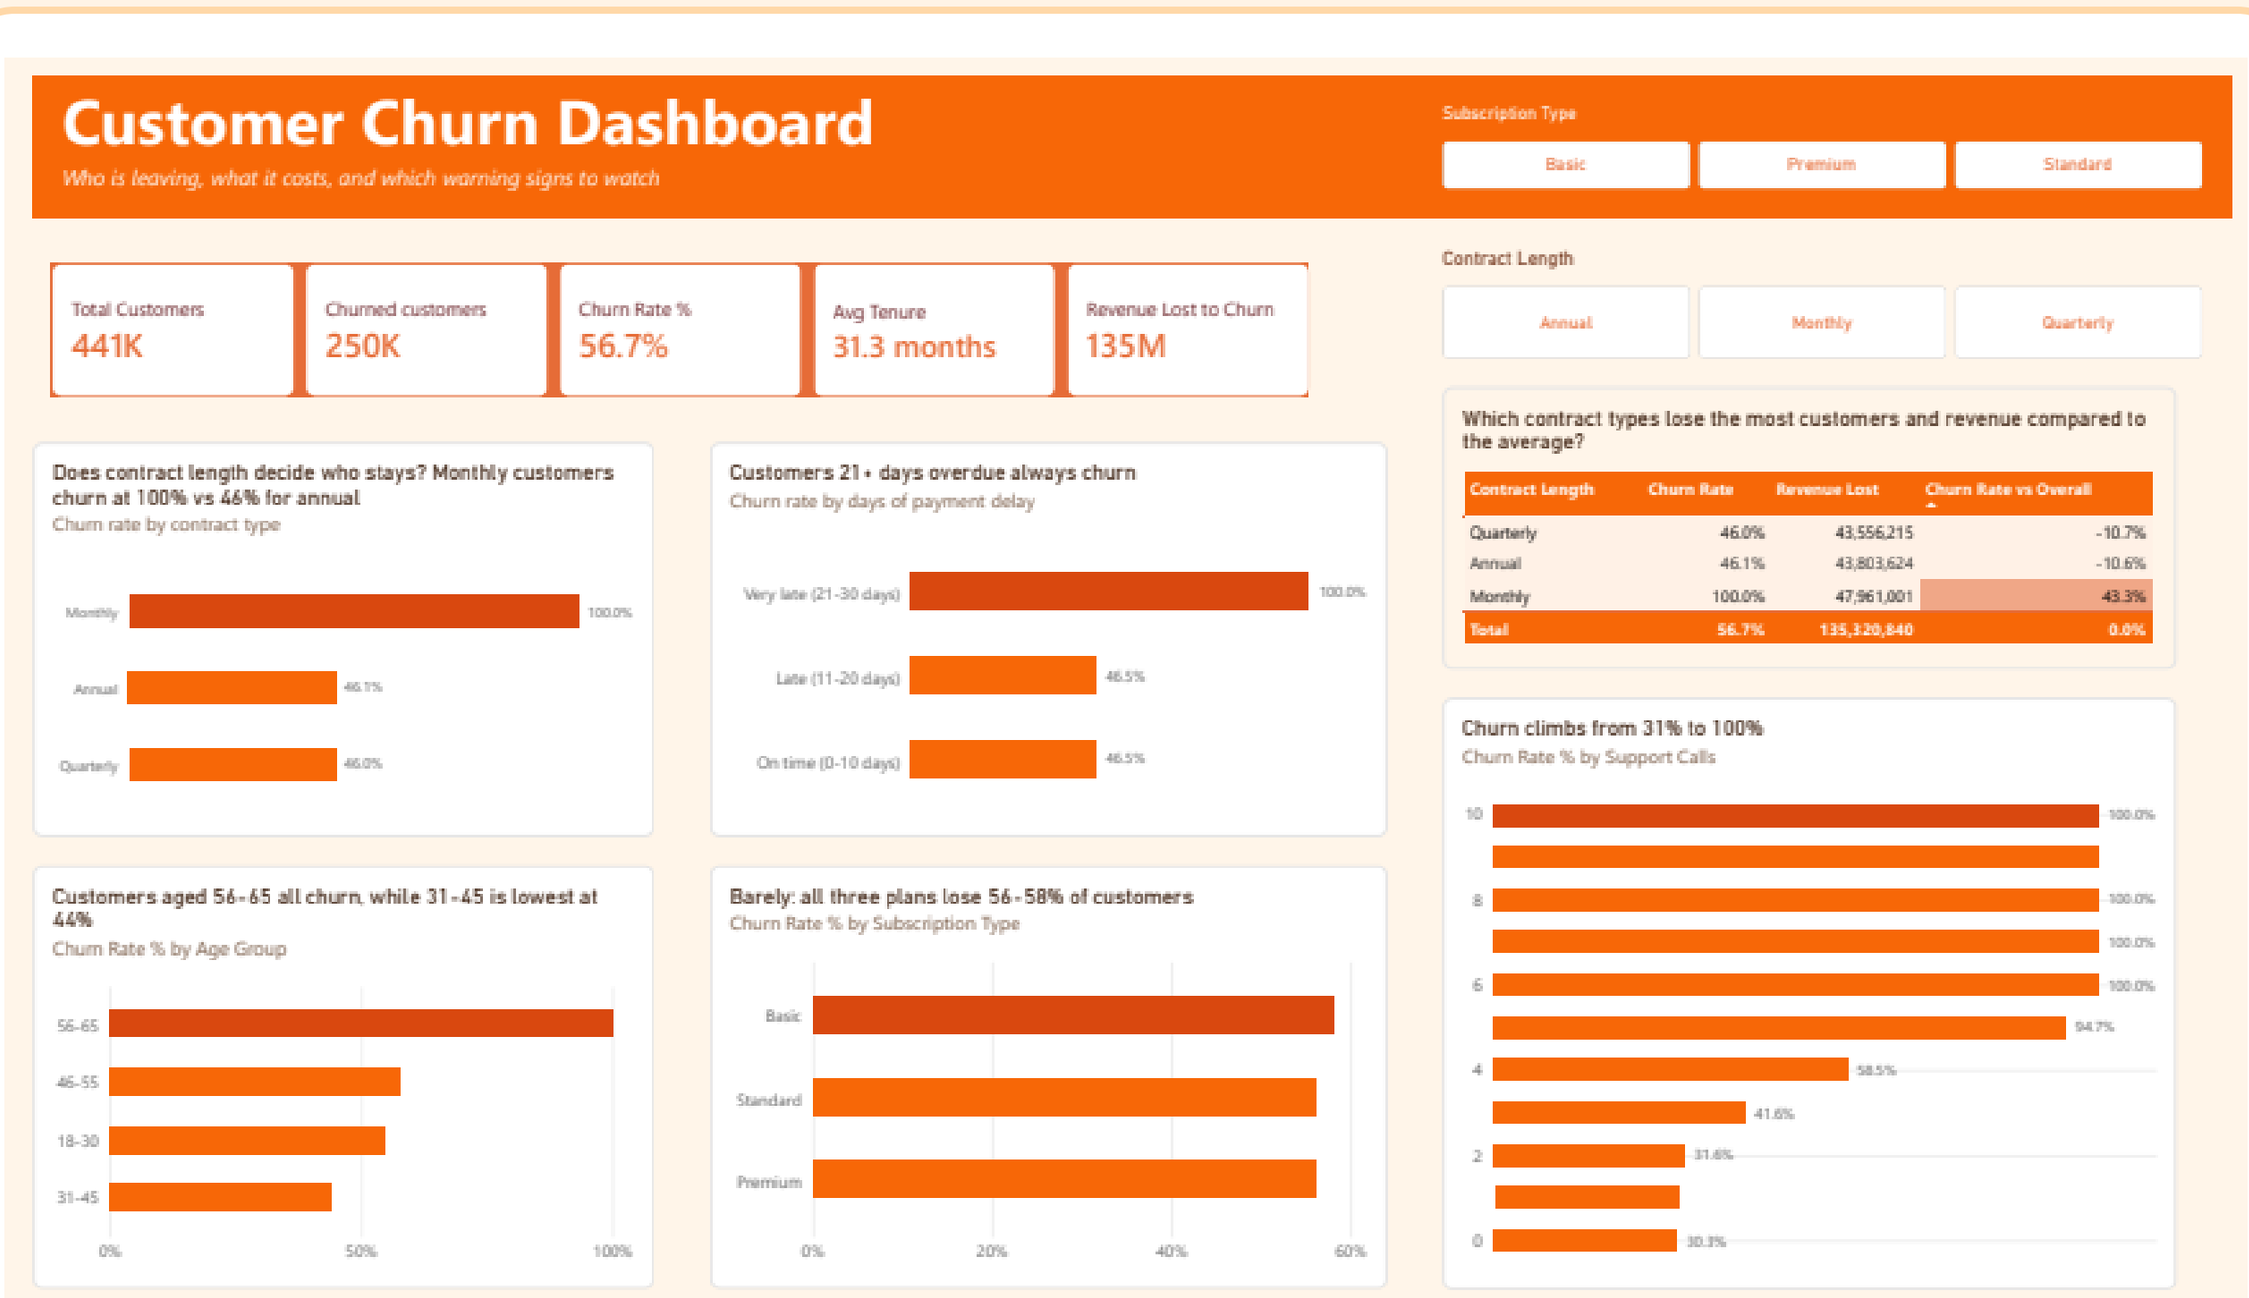

revenue lost to churn

The questions behind the dashboard

- Who is leaving?
- What warning signs show up before they leave?
- Which active customers should we contact next?

Data: public churn sample dataset (training file: 440,832 customers).

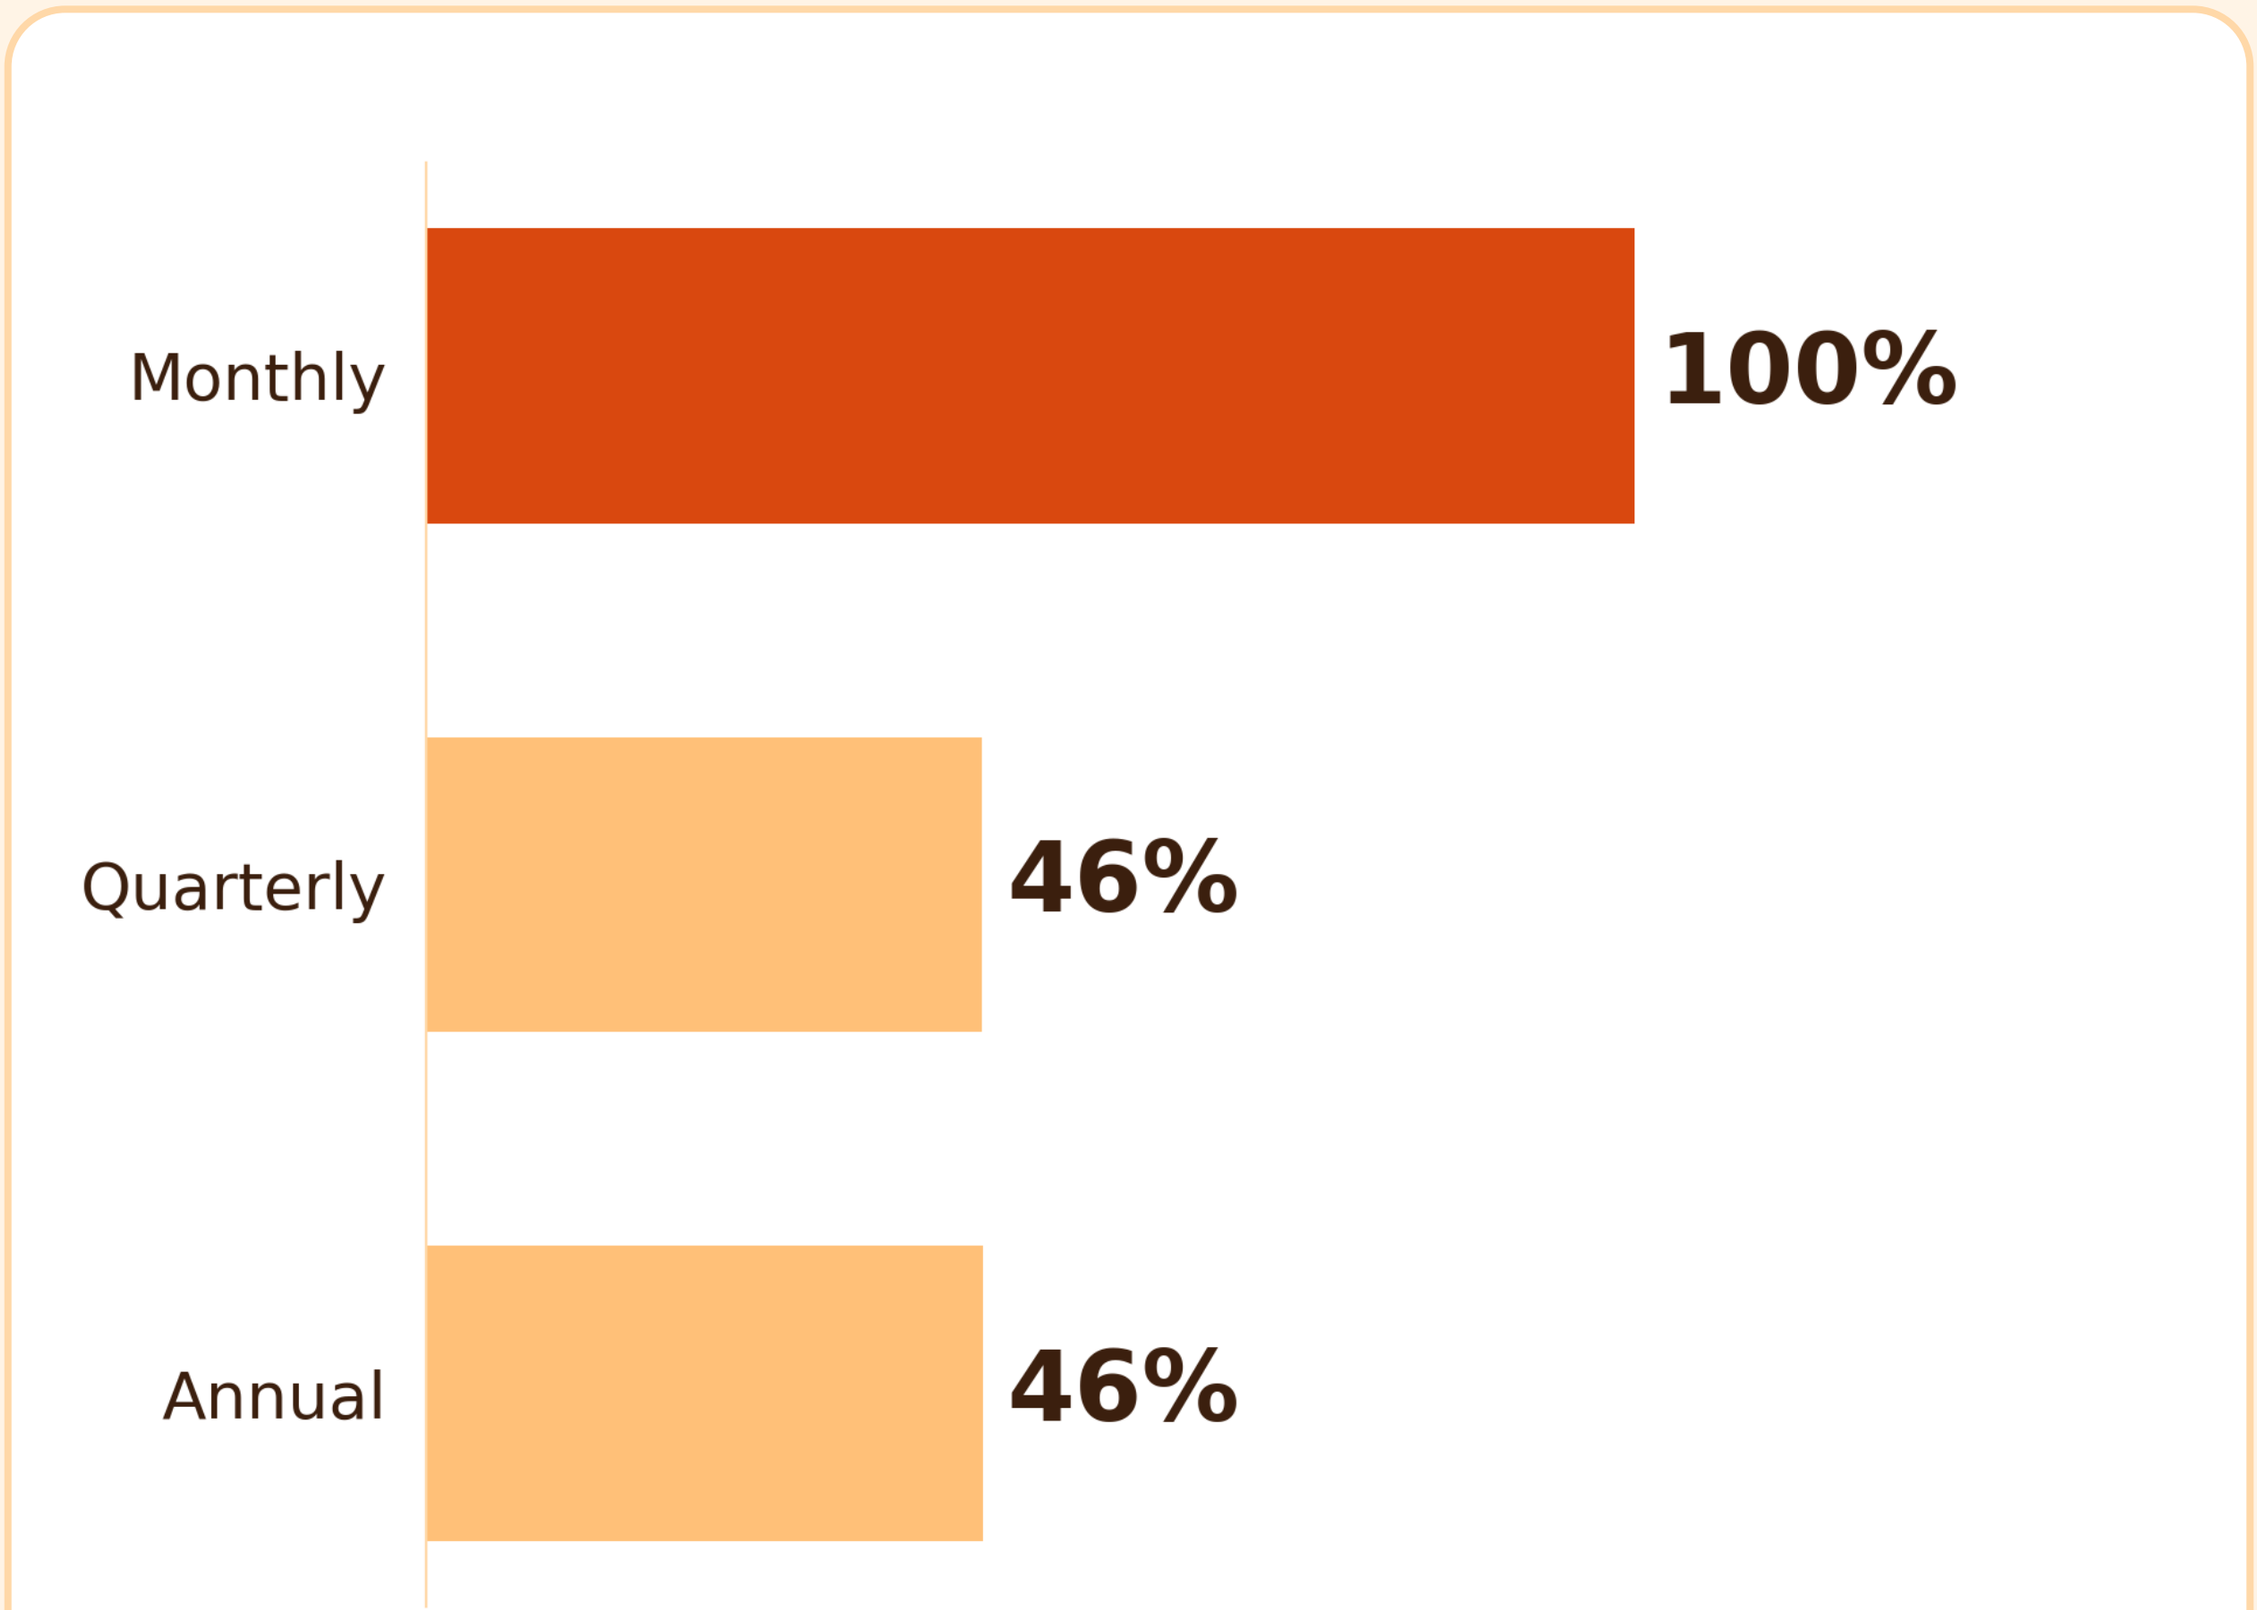

One page shows who leaves and what it costs

Overview page: KPI cards, six churn charts, slicers and a summary table.

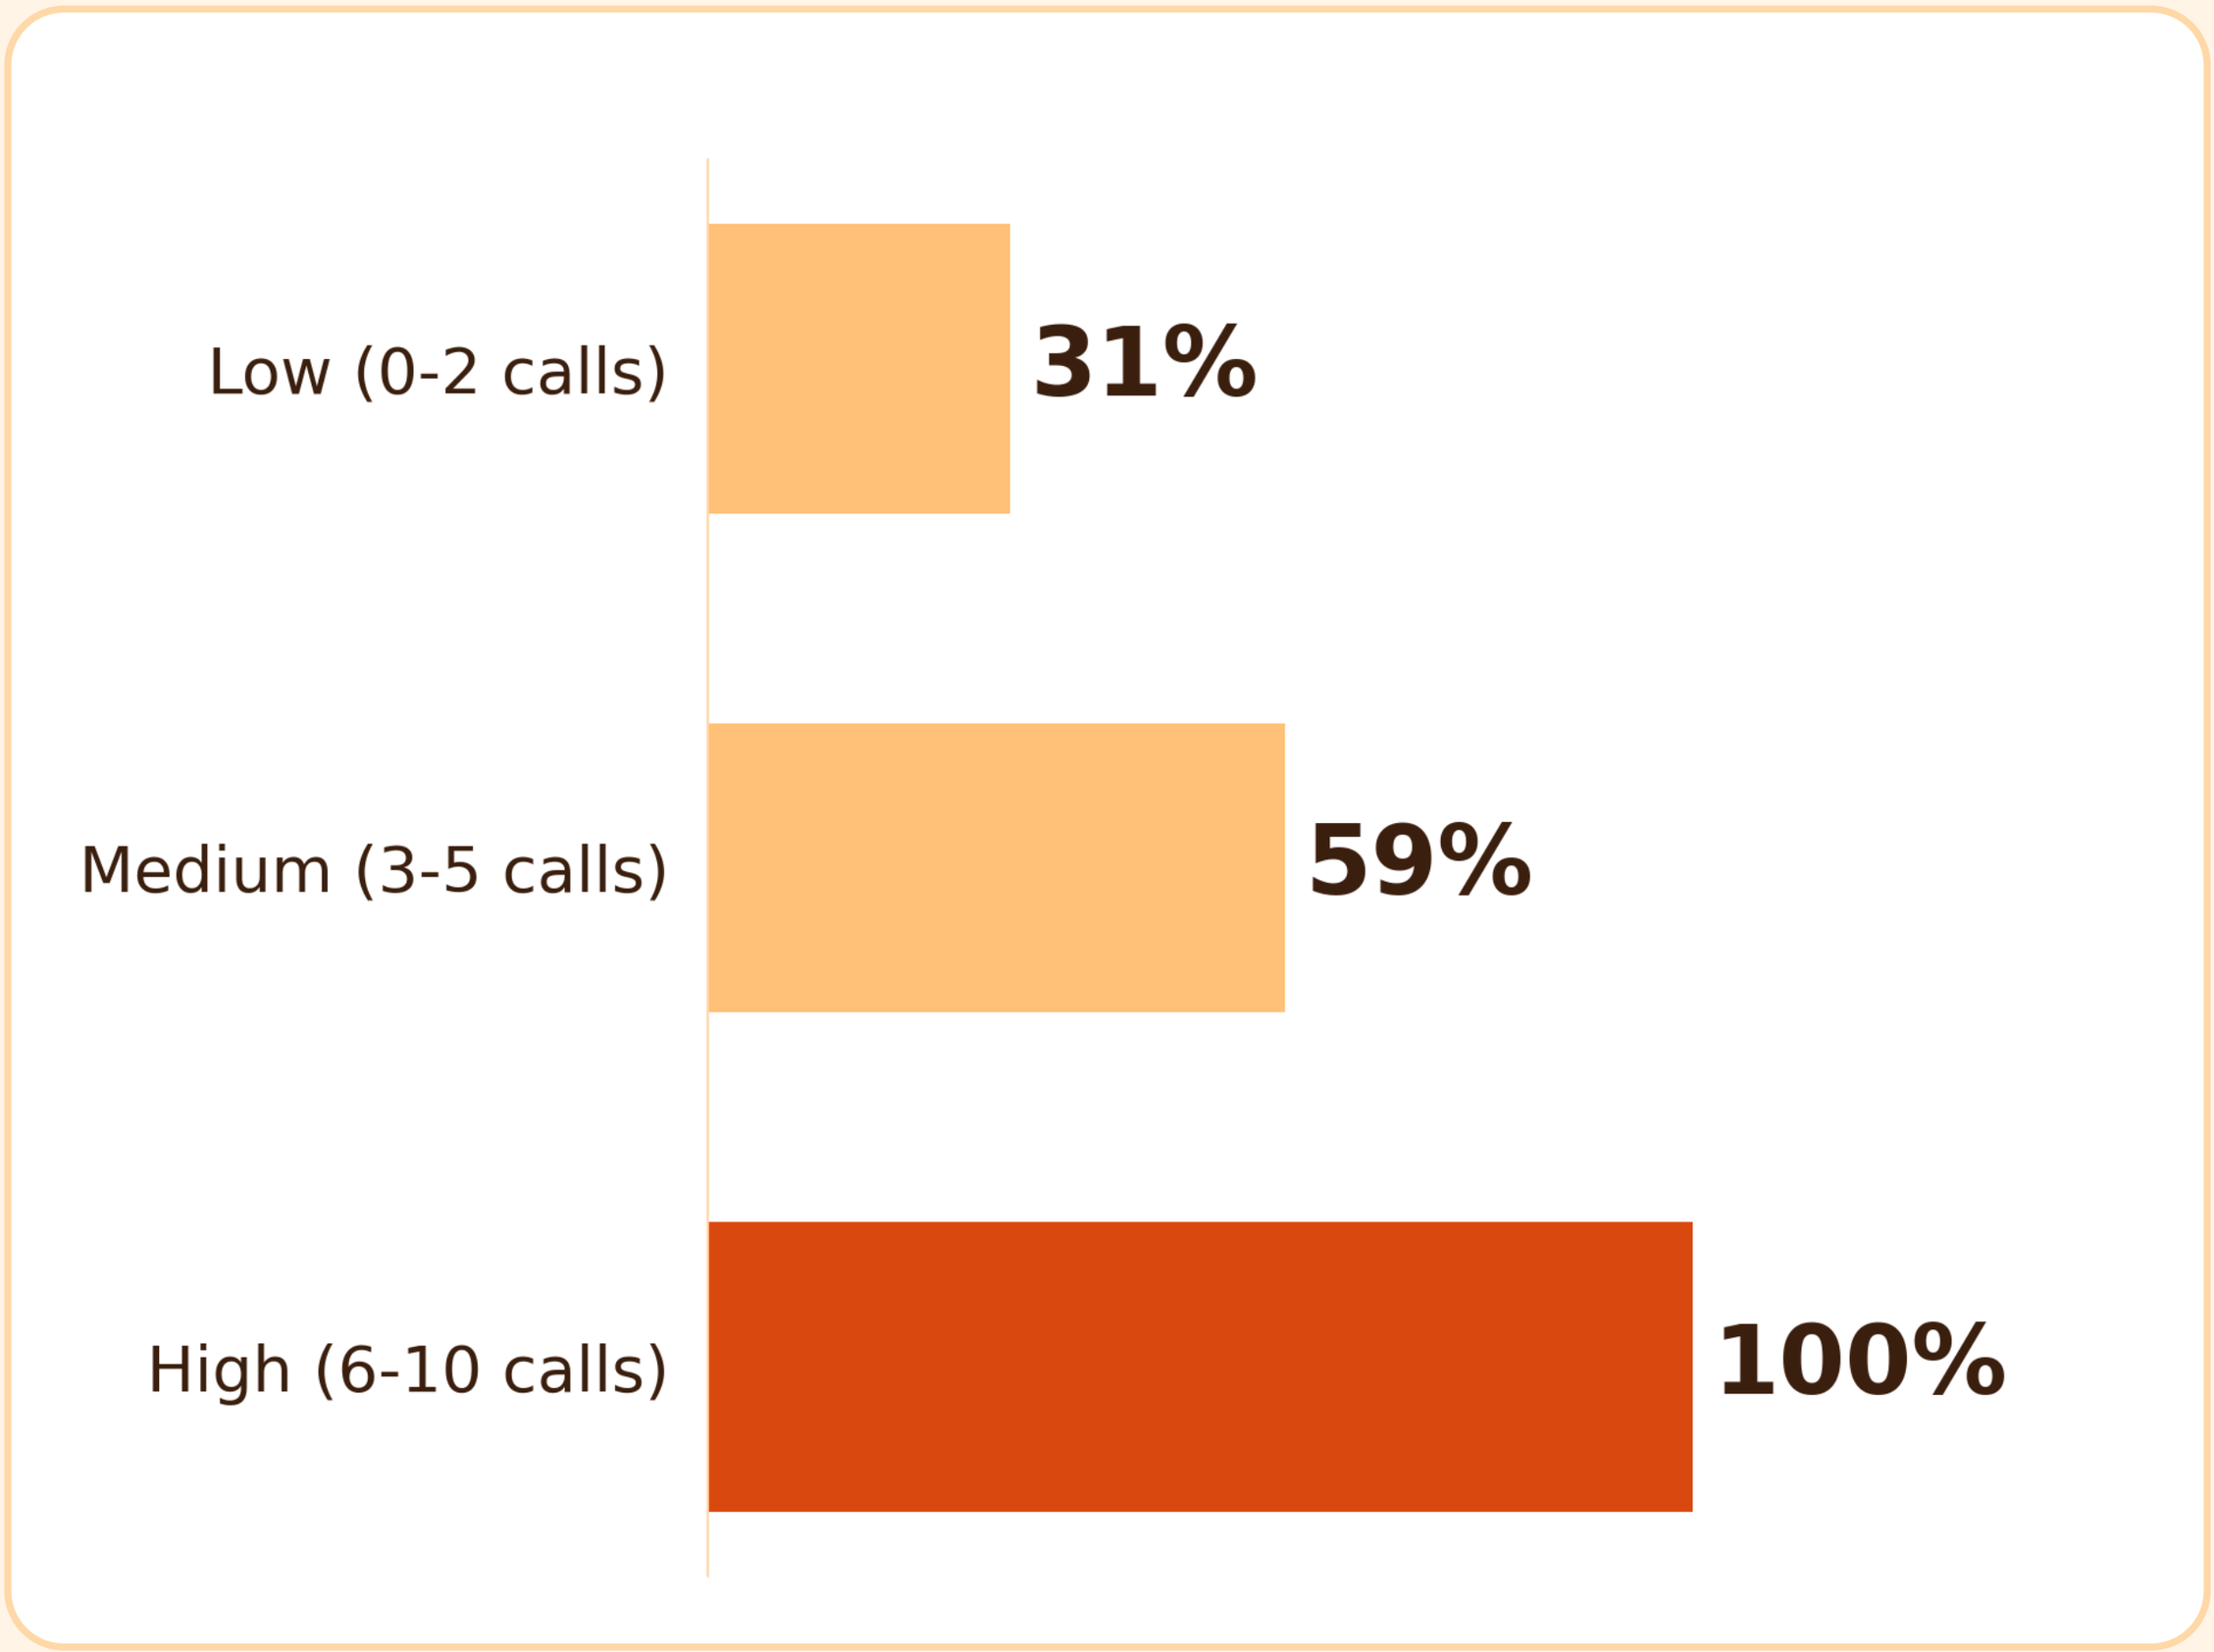

Built in Power BI with Power Query and DAX.

Monthly contracts lose every customer: 100% vs 46% for the rest

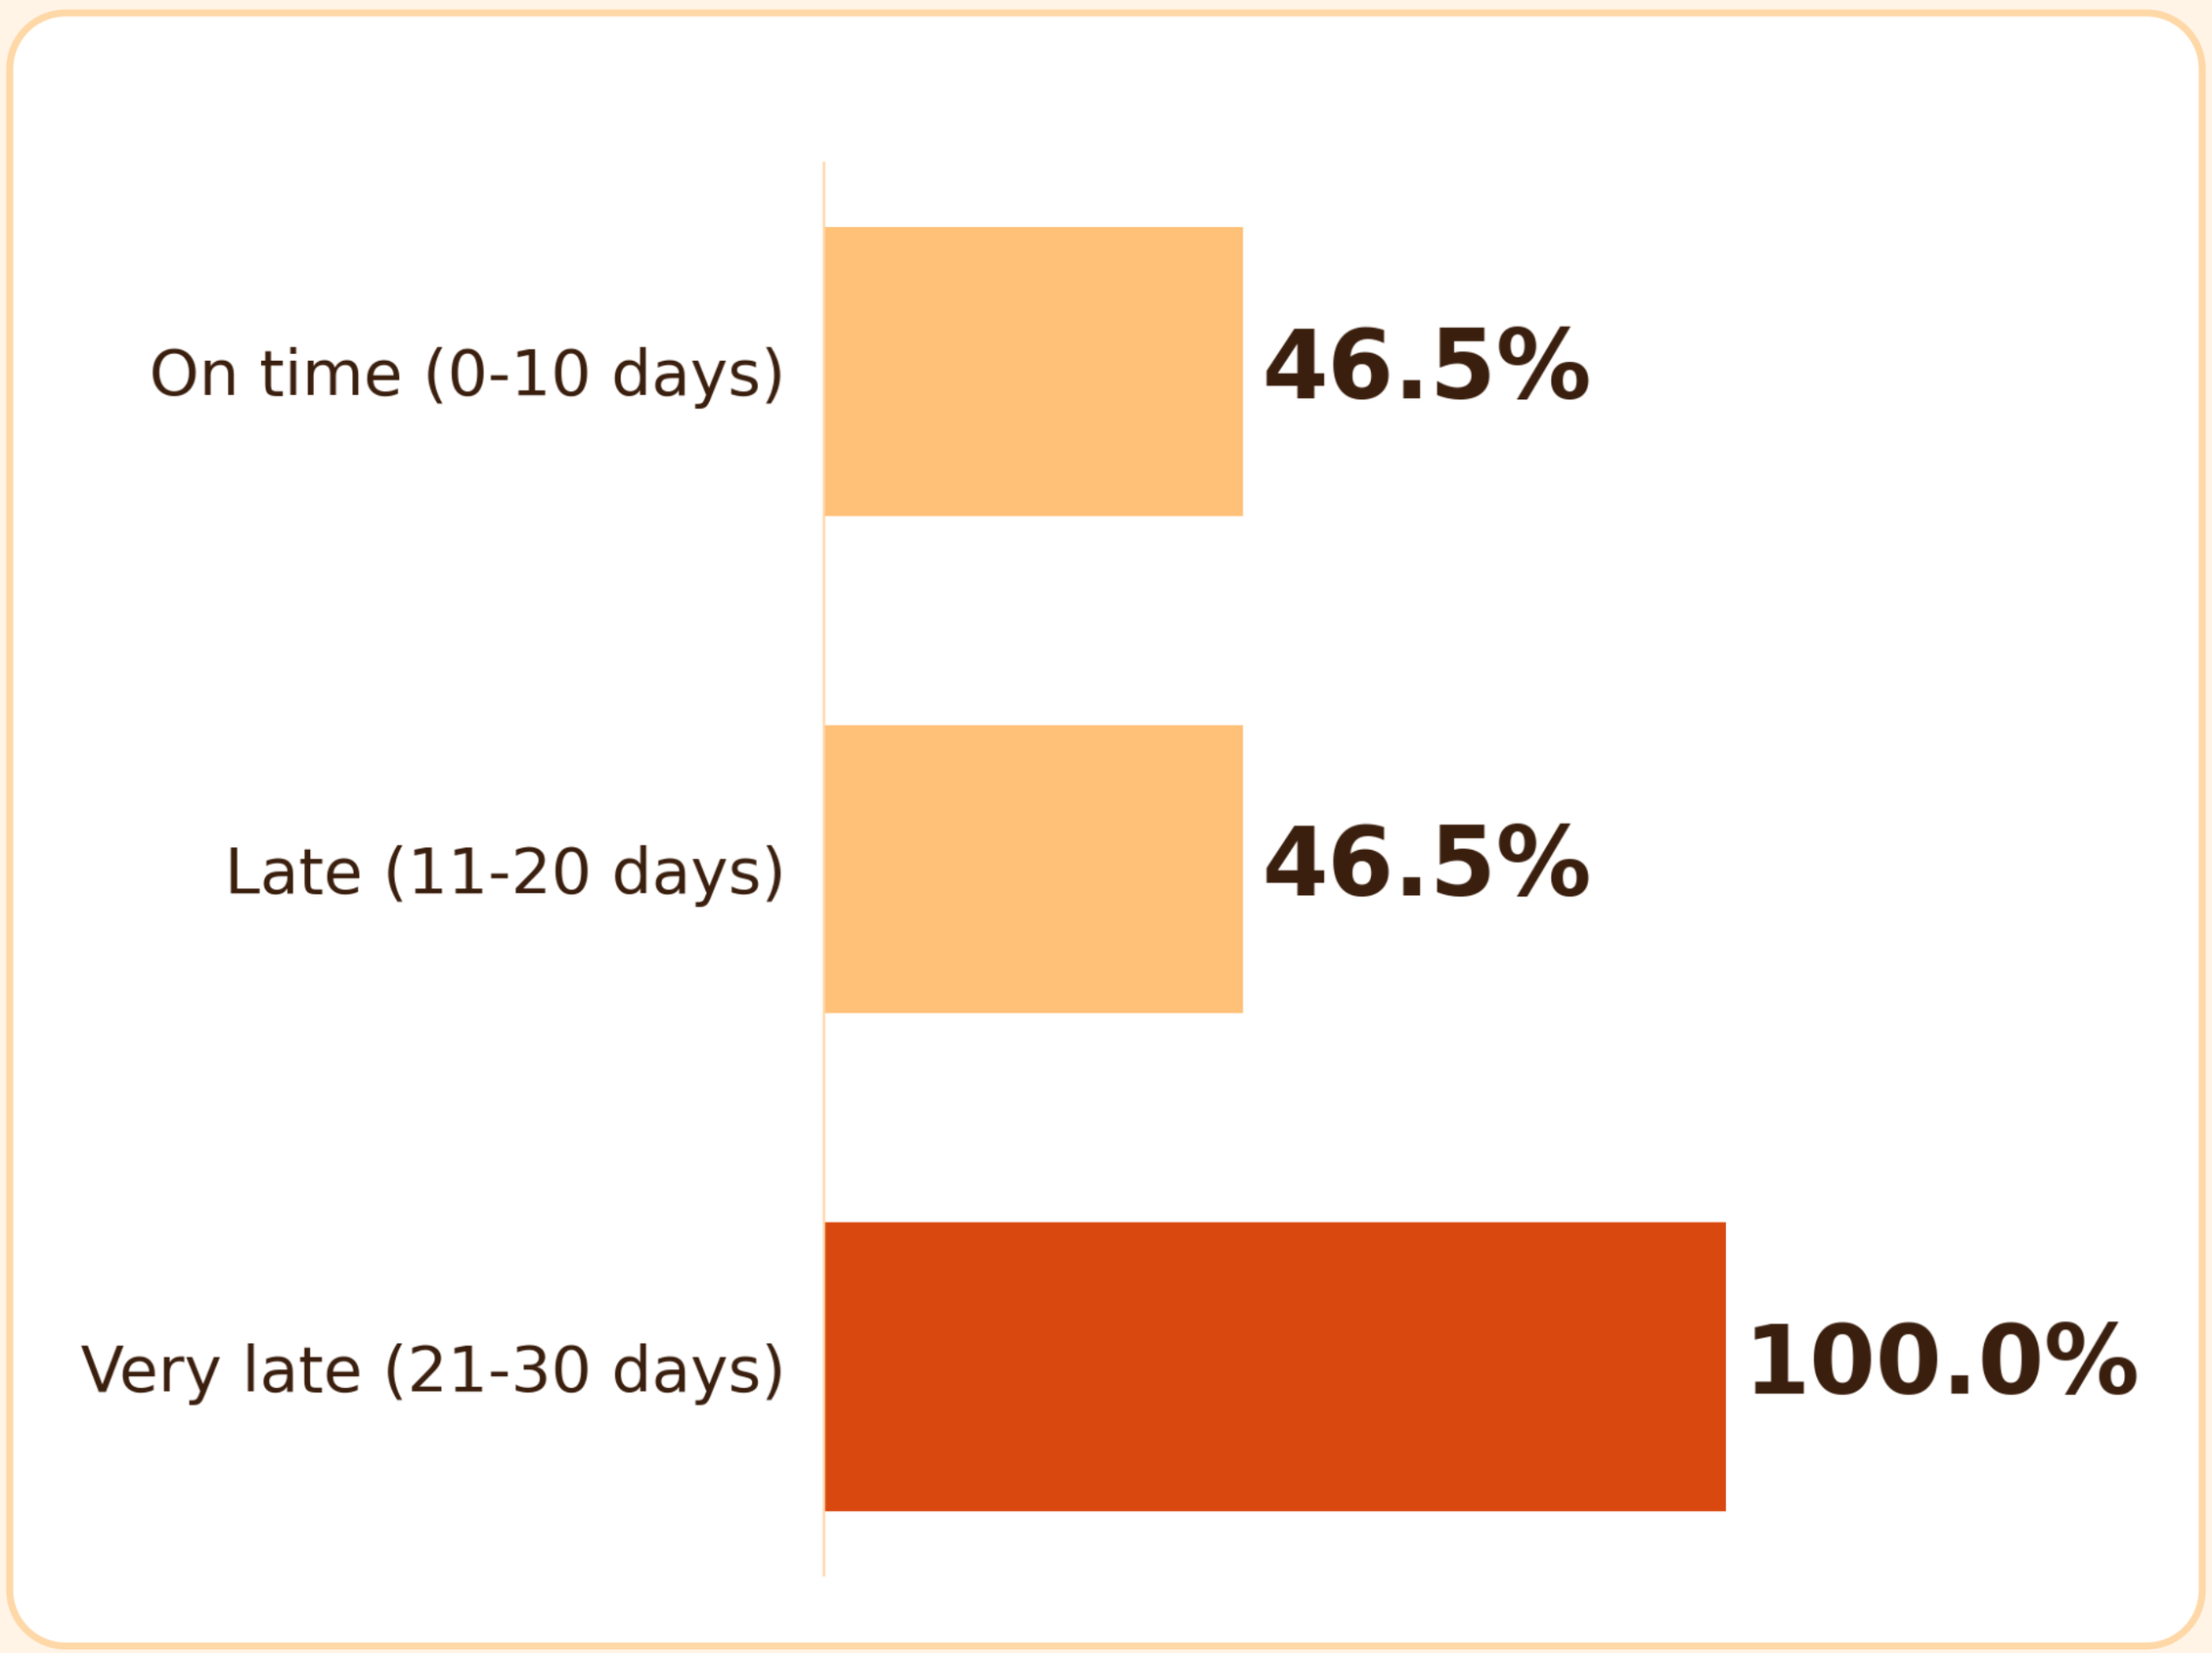

Moving customers from Monthly to Quarterly or Annual contracts is the first retention lever.

Churn climbs from 31% to 100% as support calls rise

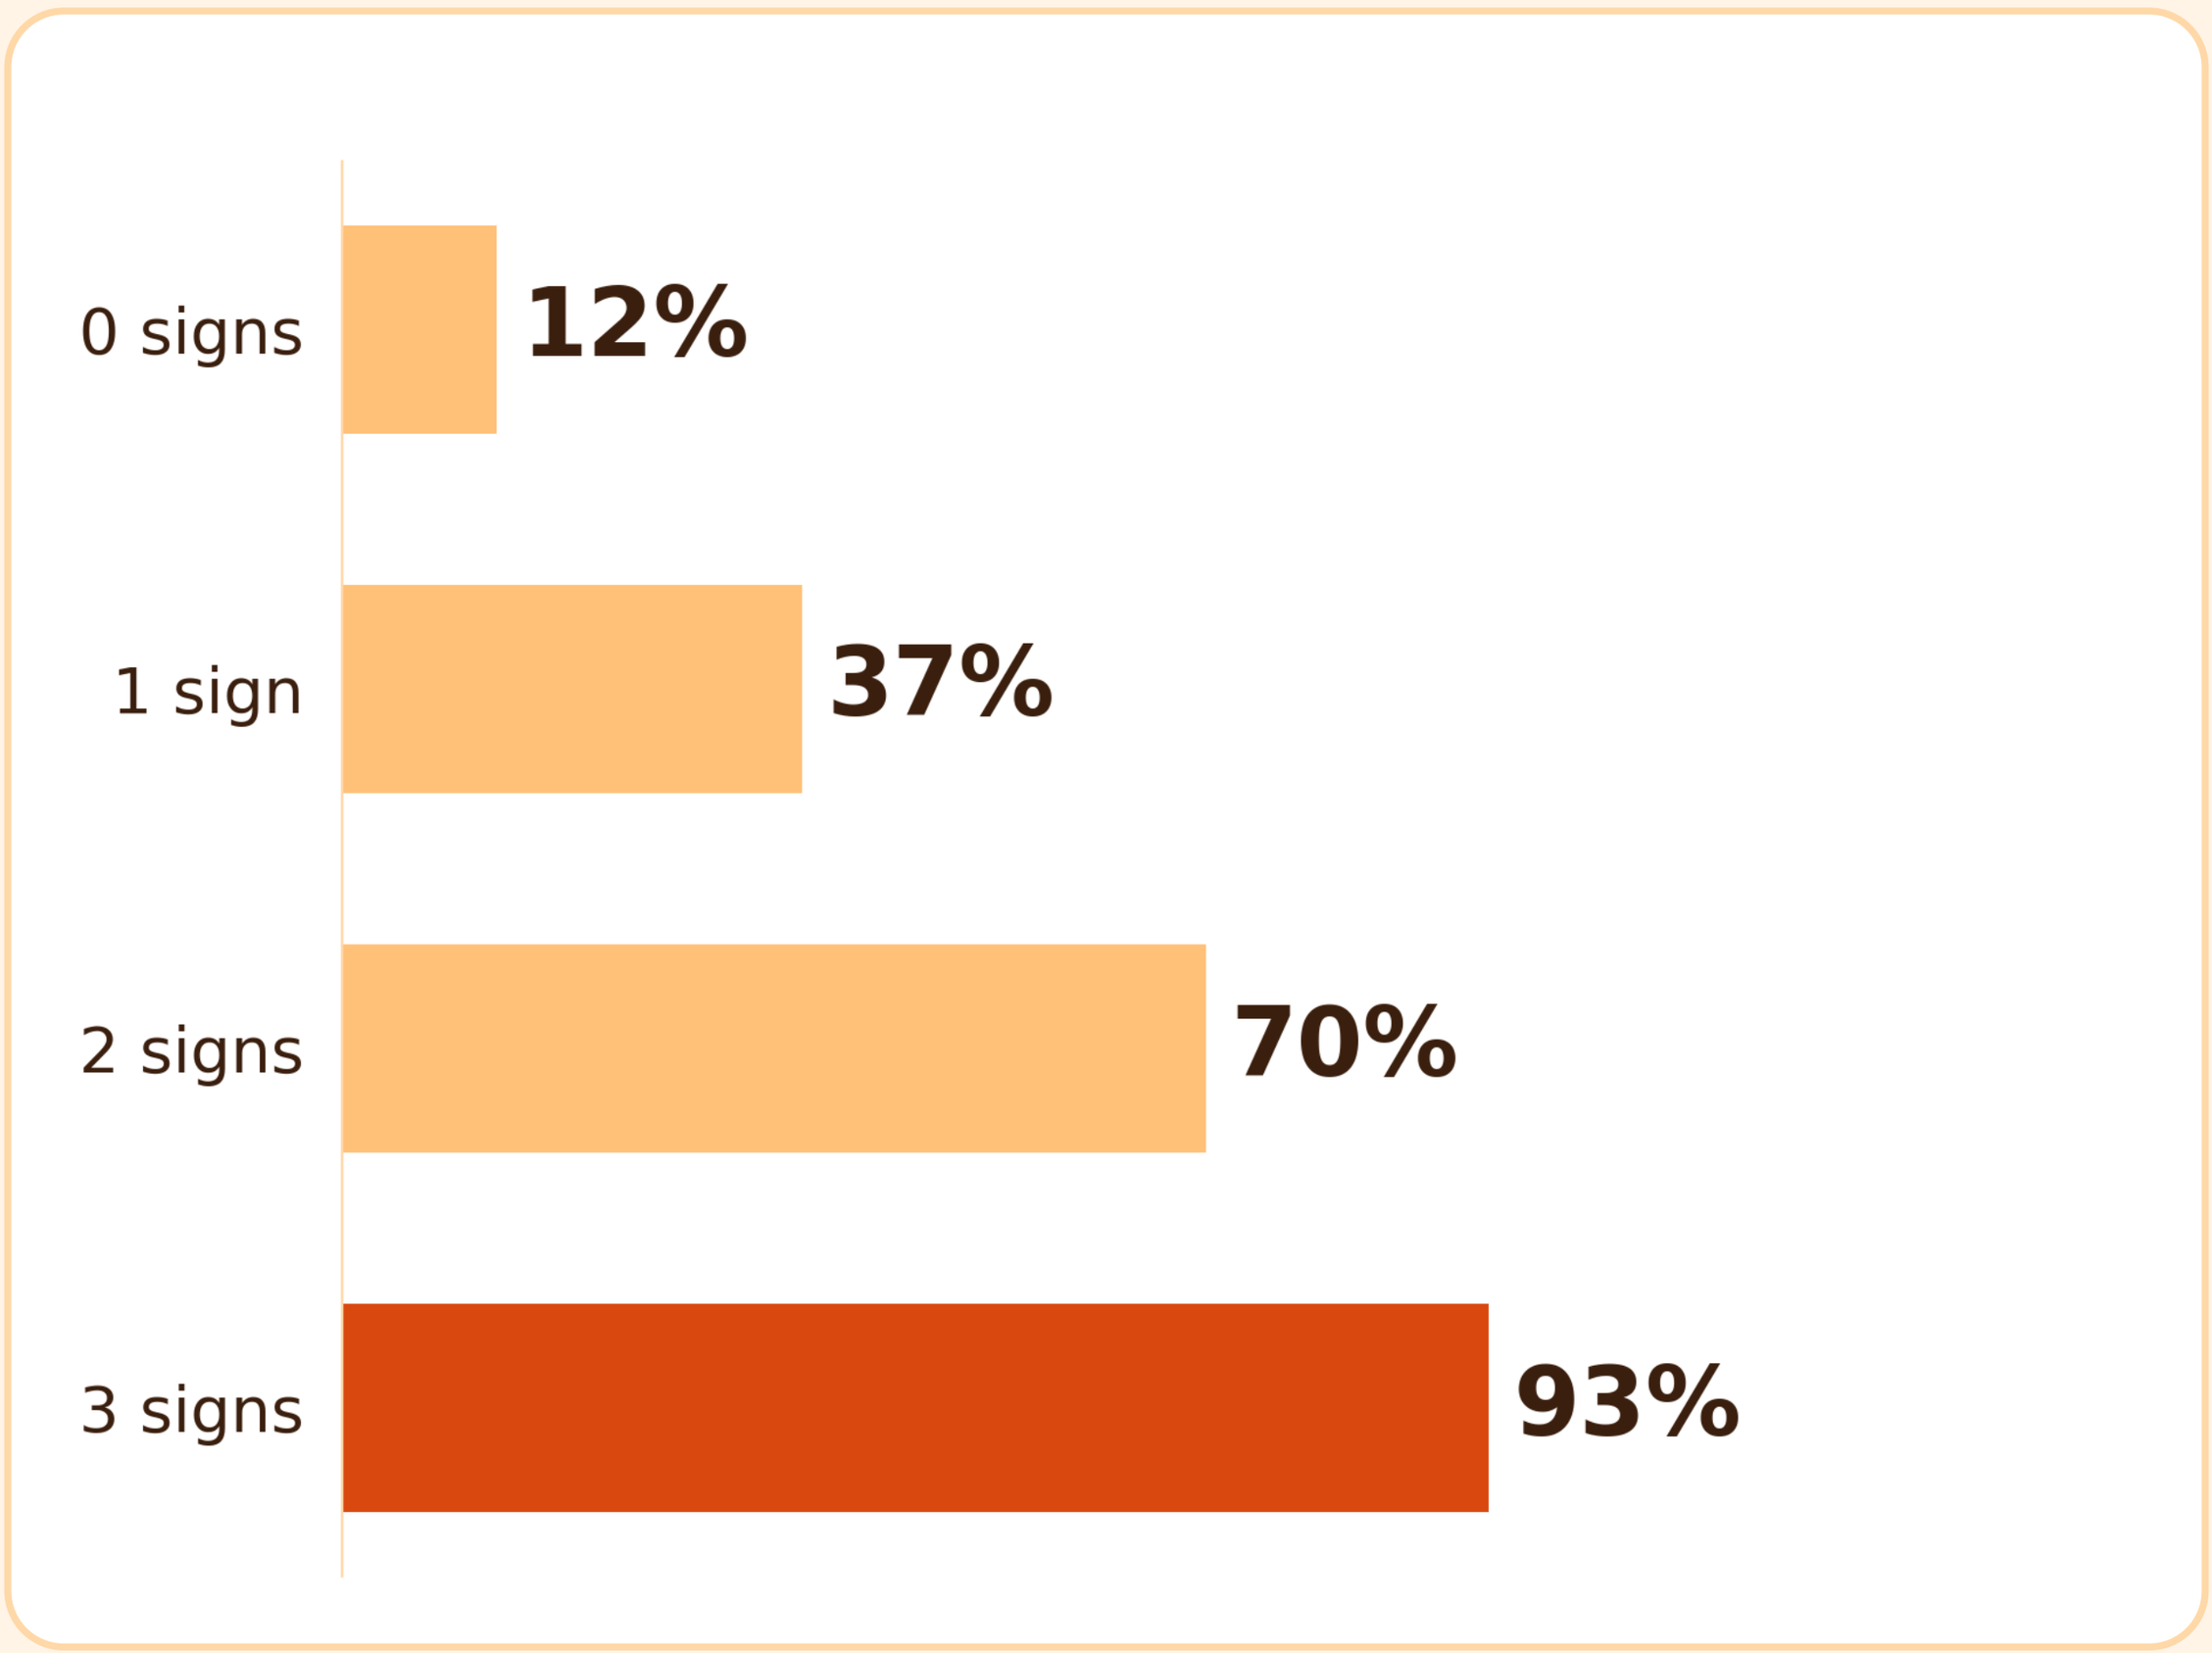

Support calls are an early warning. Follow up before a customer reaches 5 calls.

Customers 21+ days late on payment always churn

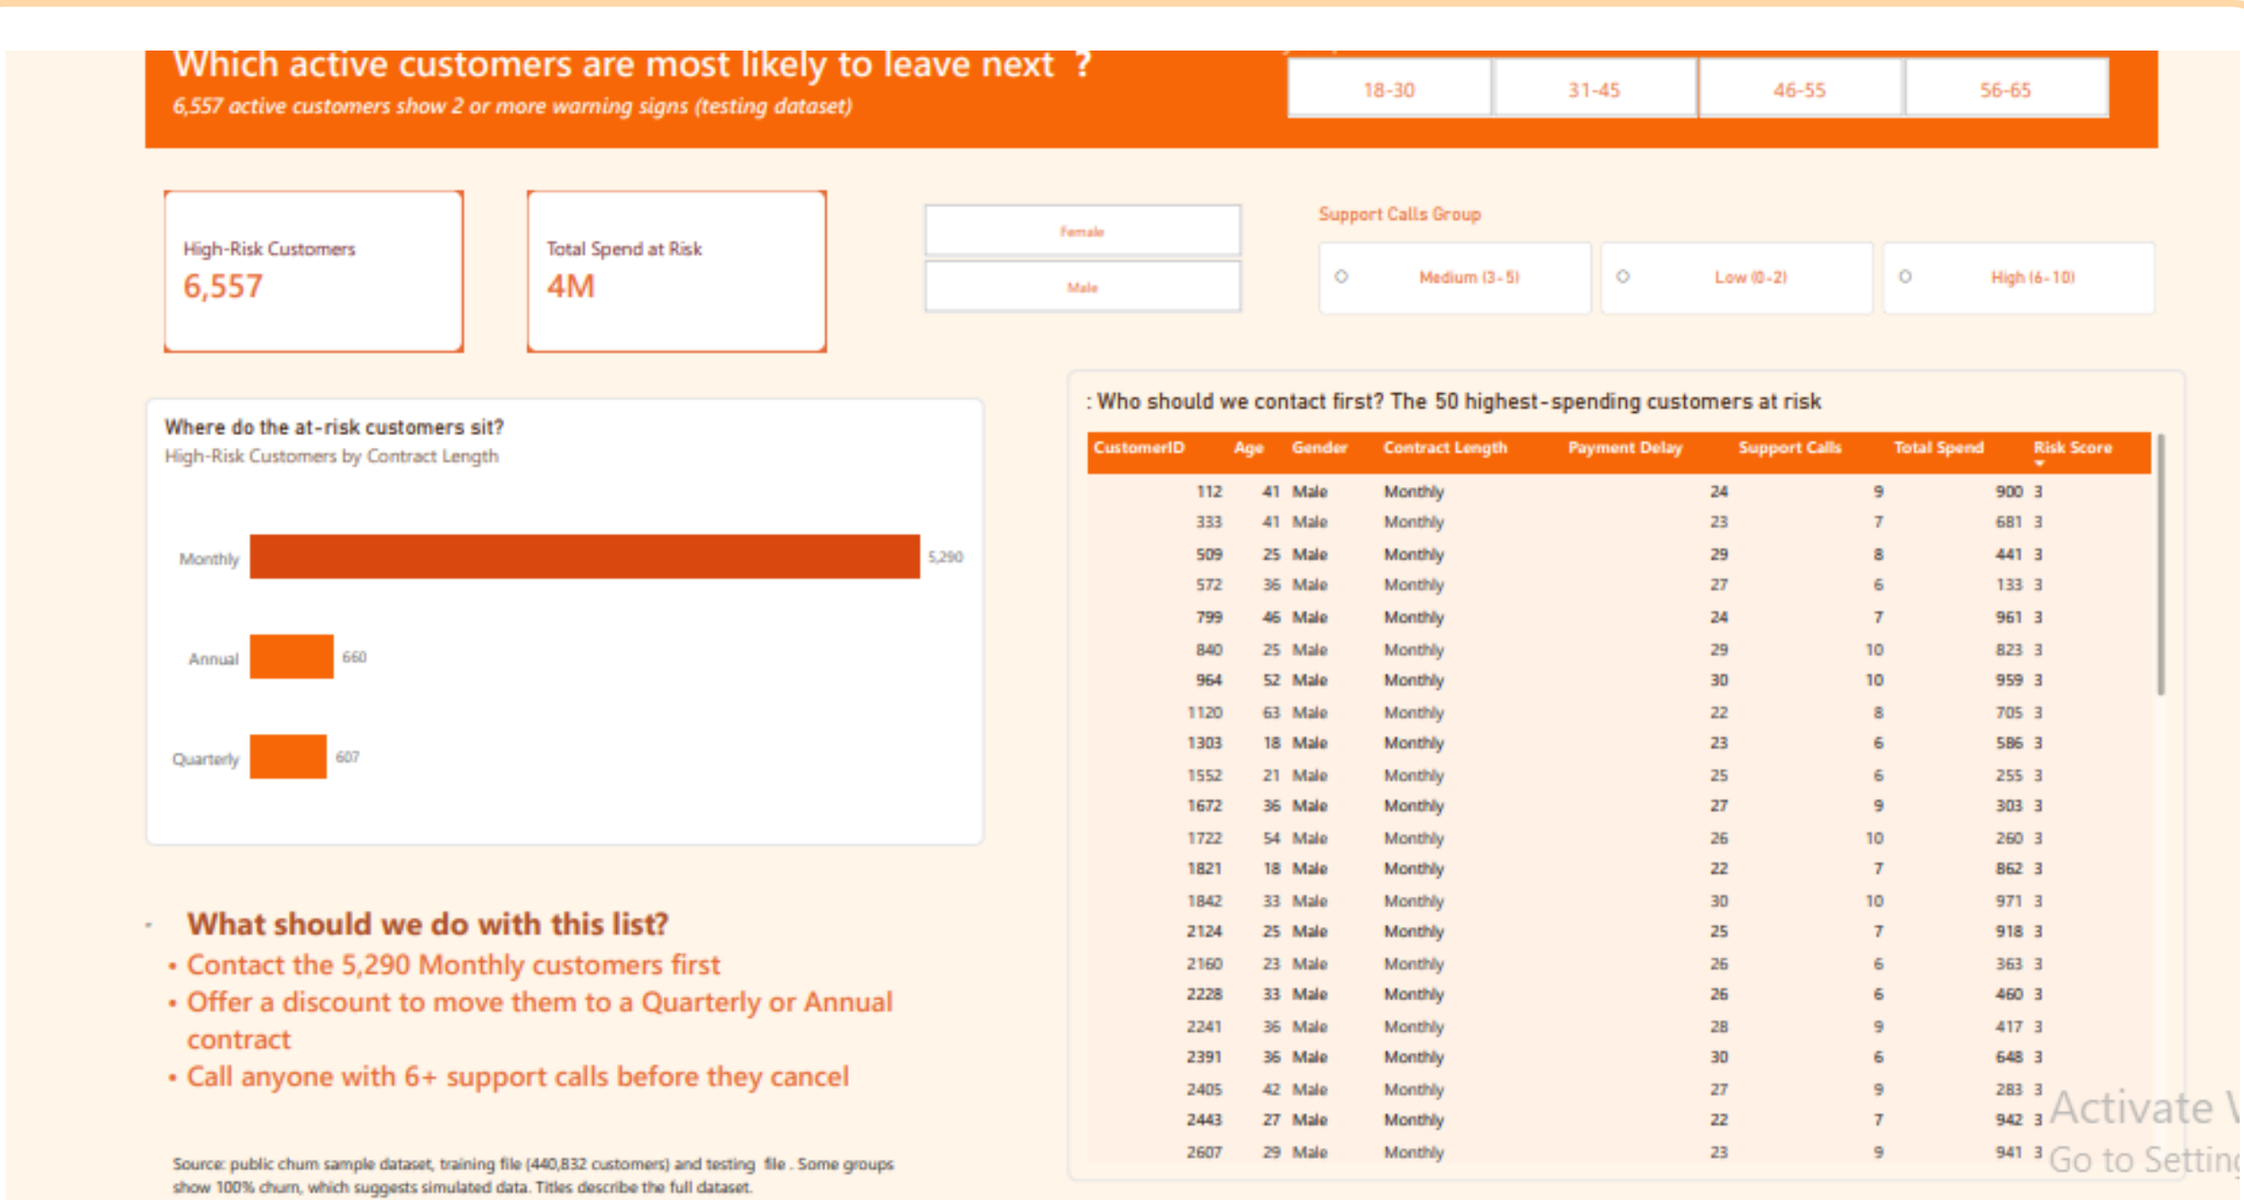

Late payment is a clear signal. Reach out around day 10, before day 21.

Churn rises from 12% to 93% as warning signs add up

Signs: Monthly contract, 6+ support calls, 21+ days late. Based on the testing dataset.

6,557 active customers are at risk, and 5,290 are on Monthly contracts

Risk page: at-risk customers by contract type, plus a call list of the 50 highest-spending.

What should the business do now?

1. **Offer a discount to move Monthly customers to a Quarterly or Annual contract.**

2. **Follow up when a customer reaches 5 support calls, before the 6th.**

3. **Contact customers 10 days late on payment, before they reach 21 days.**

4. **Start with the high-spend at-risk customers on the call list.**

SKILLS BEHIND THIS DASHBOARD

From raw CSV to a decision-ready dashboard

- Power Query: cleaning, appending two files, custom columns
- DAX: churn rate, revenue lost, dynamic titles
- Risk score and conditional formatting
- Slicers, layout and storytelling in Power BI

Data: public sample dataset. Some groups show 100% churn, which suggests simulated data.
